Camera adjustment

Configuration

The device must be physically configured in terms of:

P – Camera address

The configurator assigns to the camera the address inside the apartment.

NOTE (*) : connect an OFF configurator here to disable the microphone (function available for cameras configured from 0 to 9, for other cameras the microphone cannot be excluded).

N – Address of the handset called in case of alarm

Z – Zone of the alarm system the camera is associated to

M – Mode of operation when a camera is switched on

Each time a camera is switched on (call, selfswitching on, alarm) the MyHOME actuator and the scenario configured in A and PL are activated. When the camera is switched off, the associated actuator also switches off, while the scenario remains active.

If an actuator used by the automation system is also associated to the camera, the actuator will switch itself off when the camera is switched off, even if it was already on when the camera came on. To avoid this problem, the load should be activated using an actuator F411/2, configuring different PL and setting the contacts with parallel connection.

M	A/PL
M = 0	Address of the SCS control device associated to the camera
M = 1 - 9	Address of the scenarios module associated to the camera

	P	N	Z	M	A	PL
