5. GENERAL CHARACTERISTICS *(continued)*

Derating of RCBO for use with fluorescent lights:

Ferromagnetic and electronic ballasts have a high inrush current for a short time. These currents can cause the tripping of RCBOs.

At the time of the installation, it should take into account the maximum number of ballasts per RCBO that the manufacturers of lamps and ballasts indicate in their catalogues.

Influence of the altitude:

	≤2000 m	3000 m	4000 m
Dielectric holding	2 000 V	1 750 V	1 500 V
Max operational Voltage	250 V	250 V	250 V
Derating at 30° C	none	none	none

Derating of RCBOs function of the number of devices side by side:

When several RCBOs are installed side by side and operate simultaneously, the thermal evacuation of the poles is limited. This results in an increase in operating temperature of the RCBOs which can cause unwanted tripping. It is recommended to apply the following coefficients to the rated currents.

Number of RCBOs side by side	Coefficient
2 - 3	0.9
4 - 5	0.8
6 - 9	0.7
≥ 10	0.6

These values are given by the recommendation of IEC 60439-1.

To avoid using these coefficients, it is necessary to allow a good ventilation and to separate the devices with 0.5 module spacing elements (F80/05De).

Please call an electrician immediately if this does not happen as the safety level of your installation has been reduced
- . The presence of residual current protection does not remove the need to observe all the precautions associated with using electrical energy.
